REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance:

The prior art does not show or fairly suggest the claimed invention of a projection optical system having the claimed structure and claimed limitations, wherein a rejection under 35 USC 102 or 103 would be improper. Please particularly note the combination of claimed elements and claimed limitations, including as recited in claim 1, a projection optical system for imaging a first object into a region of a second object using light of a wavelength shorter than 250 nm, the projection optical system comprising: a plurality of lenses disposed along an optical axis of the projection optical system; wherein the plurality of lenses is dividable into four non-overlapping groups of lenses, such that a total refractive power of a first group disposed closest to the first object is a negative refractive power, a total refractive power of a second group disposed directly adjacent to the first group is a positive refractive power, a total refractive power of a third group disposed directly adjacent to the second group is a negative refractive power, and a total refractive power of a fourth group disposed directly adjacent to the third group is a positive refractive power; and wherein the relational condition is fulfilled; as recite in claim 45, a projection optical system for imaging a first object into a region of a second object using light of a wavelength shorter than 250 nm, the projection optical system comprising: a plurality of lenses disposed along an optical axis of the projection optical system; wherein the plurality of lenses is dividable into four non-overlapping groups of lenses, such that a total refractive power of a first group disposed closest to the first object is a negative refractive power, a total refractive power of a second group

disposed directly adjacent to the first group is a positive refractive power, a total refractive power of a third group disposed directly adjacent to the second group is a negative refractive power, and a total refractive power of a fourth group disposed directly adjacent to the third group is a positive refractive power; and wherein the relational condition is fulfilled; as recited in claim 47, a projection optical system for imaging a first object into a region of a second object using light of a wavelength shorter than 250 nm, the projection optical system comprising: a plurality of lenses disposed along an optical axis of the projection optical system; wherein the plurality of lenses is dividable into four non-overlapping groups of lenses, such that a total refractive power of a first group disposed closest to the first object is a negative refractive power, a total refractive power of a second group disposed directly adjacent to the first group is a positive refractive power, a total refractive power of a third group disposed directly adjacent to the second group is a negative refractive power, and a total refractive power of a fourth group disposed directly adjacent to the third group is a positive refractive power; wherein each of at least five lenses of the plurality of lenses has at least one aspherical surface, wherein an axial distance between the aspherical surface and a corresponding ideal spherical shape is more than about 300 microns and less than about 500 microns, wherein the ideal spherical shape is chosen such that a centre and a periphery of the aspherical surface are positioned on the ideal spherical shape; and as recited in claim 50, a projection optical system for imaging a first object into a region of a second object using light of a wavelength shorter than 250 nm, the projection optical system comprising: a plurality of lenses disposed along an optical axis

of the projection optical system; wherein the plurality of lenses is dividable into four non-overlapping groups of lenses, such that a total refractive power of a first group disposed closest to the first object is a negative refractive power, a total refractive power of a second group disposed directly adjacent to the first group is a positive refractive power, a total refractive power of a third group disposed directly adjacent to the second group is a negative refractive power, and a total refractive power of a fourth group disposed directly adjacent to the third group is a positive refractive power; and wherein the relational condition is fulfilled.

Therefore, the claimed invention is considered to be in condition for allowance as being novel and nonobvious over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Drawings

2. The drawings were received on 2-17-07. These drawings are approved.

Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
